 - CODES DEVELOPED:
 - SAE-TDSE: A highly efficient single-active electron time-dependent atomic code for strong-field ionization, strong-field excitation, streaking, high-order harmonic generation, and quantum trajectory computation. The code can treat random light polarization and vortex beams. Non-uniform grid and flux (t-SURFF) methods are implemented in the code.
 - LOPT-CK: A lowest-order perturbative method based on the Complex Kohn variational method to describe atomic and molecular photoionization with electron correlation with few-photon exchange.
 - ATTOMESA: A non-perturbative time-dependent code for atomic and molecular strong-field photoionization and high harmonic generation based on the MESA quantum chemistry code and on Finite-Element Discrete Variable Representation.
 - IT SKILLS:
 - Operational systems: OS X, Unix, and Windows
 - Programming languages: C, C++, PYTHON, and FORTRAN
 - Quantum Chemistry codes: MESA, MOLPRO, and COLUMBUS
