Introducing A New Course in Sociology

SYO3930 Special Topics
Social Networks: Theory and Applications

Monday 6-8:50pm VW11-331 & Webcourses

Social phenomena occur in social relationships. This course invites you to study our social world from a relational perspective – i.e., connecting the dots!

You will “see” the structure and processes of many interesting topics in sociology as social networks. In particular, we will explore how social network theory and analysis can be applied to the following topics: health & disease, the environment, and political economy. No statistical or programming skills required.
